Why fold 2 RNA molecules

Many RNA functions mediated by intermolecular RNA interactions

- miRNA-siRNA pathway
- RNA editing
- Design of custom-made RNA molecules
 - e.g. "openers" for binding sites

Intermolecular interactions of RNA molecules

Nature Reviews | Molecular Cell Biology

Sfold by Ding & Lawrence

- Internal stability profile of small RNAs (5' and 3' end, average internal stability, ...)
- probability profiling for prediction of unstructured regions in the target RNA:
 - generate a representative statistical sample of target RNA structures

Problems

Solution?

- Great Unified Cofolding Algorithm
- Cofolding including intermolecular Pseudo-knots and pair probabilities

 Will be expensive computationally and in memory requirements

Unification of RNAcofold and RNAup

First assume no intramolecular base pairs in smaller molecule

- Start with Cofold $\mathcal{O}((n_A + n_B)^3)$ proc. $\mathcal{O}((n_A + n_B)^2)$
- ► Use RNAup routines, compute intermolecular partition functions (O(n³))
- ► Use RNAup routines, compute partition functions given that pair *i*, *j* is innermost base-pair enclosing a binding site. (O(n³))

(日) (日) (日) (日) (日) (日) (日)

Unification II

- Compute partition functions given duplex between *i* and *j* (Like Fold, (O(n³)))
- Compute partition functions for intra-molecular pairs given Pseudo-knot. O(n³)

(日) (日) (日) (日) (日) (日) (日)

Run modified RNAup to get the partition functions of intermolecular pairs given Pseudo-knot. O(n³)

Unification III

- Will take up to six times longer than a simple Cofold
- Will take four to six times more memory.
- Still has time complexity of O(n³) in processor time and O(n²) in memory.
