tRNA Modifications

Phizicky et al., *Genes Dev.* 2010, 24: 1832-1860

- a large number exists
 - ↪ 105 are known
 - ↪ ∅ 8 modification per tRNA
 - ↪ in yeast: 25 modifications occur at 36 different positions
- They are not well understood!!!**

tRNA Modifications affect the ...

- ... regulation of translation & growth (anticodon loop)
- ... catalytic function (various positions)
- ... structural stability in terms of flexibility & rigidity (main body)

tRNA Modifications affect the ...

- ... regulation of translation & growth (anticodon loop)
- ... catalytic function (various positions)
- ... structural stability in terms of flexibility & rigidity (main body)
 - ↔ dihydrouridine in the D-arm promotes the C2'-endo sugar conformation
 - ↔ are found in psychrophilic organism as a strategy for cold adaption
 - ↔ plays a role in the temperature adaption of organism

Motivation

1. many modifications are recognizable in RNA-seq data as sequencing errors

Motivation

1. many modifications are recognizable in RNA-seq data as sequencing errors
 - ↔ develop a bioinformatic pipeline
 - ↔ understand the evolutionary function and conservation
 - ↔ analyze the variation across different cell types and tissues

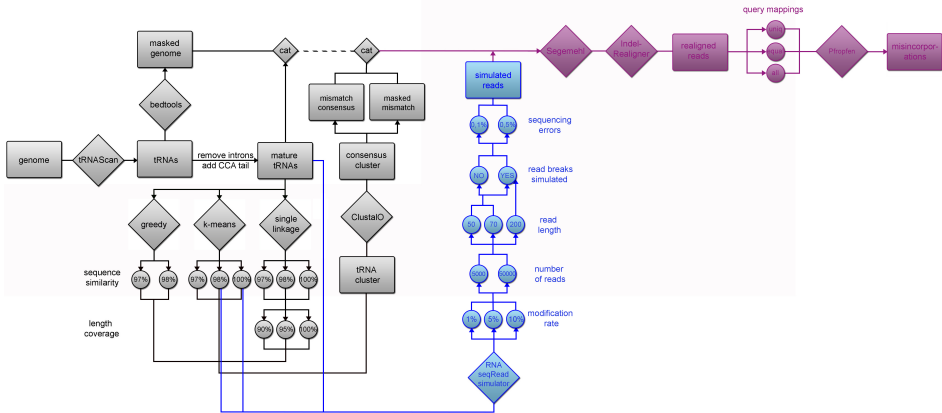

Motivation

1. many modifications are recognizable in RNA-seq data as sequencing errors
 - ↔ develop a bioinformatic pipeline
 - ↔ understand the evolutionary function and conservation
 - ↔ analyze the variation across different cell types and tissues
2. many modifications modulate the tRNA structure

Motivation

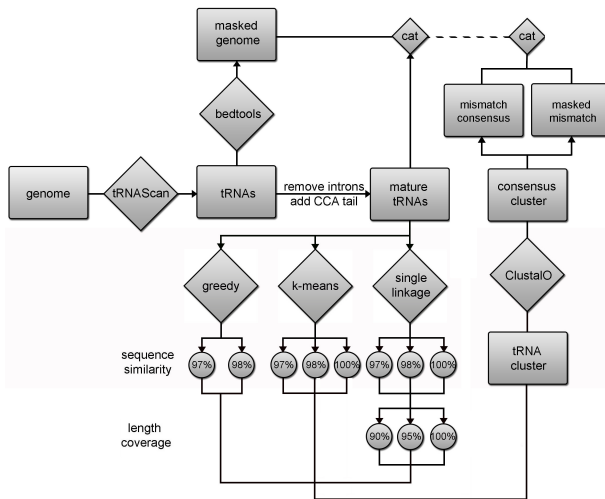

1. many modifications are recognizable in RNA-seq data as sequencing errors
 - ↔ develop a bioinformatic pipeline
 - ↔ understand the evolutionary function and conservation
 - ↔ analyze the variation across different cell types and tissues
2. many modifications modulate the tRNA structure
 - ↔ understand the correlation with temperature adaption
 - ↔ analyze it in psychrophilic to thermophilic bacteria
 - ↔ analyze it in yeast
 - ↔ analyze treated vs. untreated RNA-seq data

Simulation Testing

- adjust the parameters to improve the pipeline
- validate the pipeline by testing it with simulated NGS data

Simulation Testing - Genome Preparation

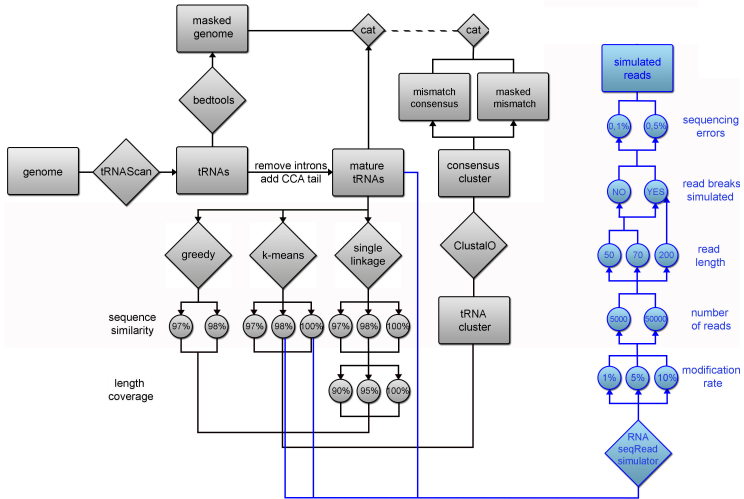

Simulation Testing - Genome Preparation

→ comparisons of different sequence similarities (greedy)

Simulation Testing - Read Simulation

Simulation Testing - Read Simulation

→ comparisons of different backgrounds (greedy, 100%)

Simulation Testing - Analysis

Simulation Testing - Analysis

- to call misincorporations
- calculate expected error rate for each substitution as background
- weight expected rates considering multimappers
- check for every genomic position the likelihood to see a certain substitution by chance given the background rate
- merge the p-value likelihoods for all substitutions with Fisher's method

Simulation Testing - Analysis

→ comparison of different query mapping filter methods vs. cluster method

→ tRNA background vs. 100% clustered tRNA background

- validate the pipeline by testing it with bigger simulated NGS data
- analyze different data sets of different species
 - ↔ understand correlation with temperature adaption
 - ↔ analyze the evolution, conservation
 - ↔ analyze the variation across different cell types and tissues

Many thanks to...

- Peter F. Stadler
- Mario Mörl
- Fabian Amman
- Christian Lorenz

...and thanks to you for your attention!
